In article number 1706913, Ali Khademhosseini, Yu Shrike Zhang, and co-workers report a multichannel coaxial extrusion system for microfluidic bioprinting of circumferentially multilayered cannular tissues in a single step, which allows these perfusable cannular constructs to be tuned continuously between monolayers and multiple layers at regular intervals across the length of a bioprinted tube.

where  $V$  is the pearlite volume fraction of the steel.. 2.3.. Mechanical property measurementsThe room temperature mechanical properties were determined by the shear punch test method, which is a small-specimen testing technique that enables the characterization of the flow behavior of the material, including elasticity followed by yielding, work hardening to a maximum stress and fracture.

Friction stir welding (FSW) is a solid-state joining process that uses a non-consumable tool to join two facing workpieces without melting the workpiece material. Heat is generated by friction between the rotating tool and the workpiece material, which leads to a softened region near the FSW tool.

Ceramic engineering is the science and technology of creating objects from inorganic, non-metallic materials. This is done either by the action of heat, or at lower temperatures using precipitation reactions from high-purity chemical solutions.

Poly (p-phenylene terephthalamide) fibers prepared by wet or dry-jet wet spinning processes have a notable response to very brief heat treatment (seconds) under tension. The modulus of the as-spun fiber can be greatly affected by the heat treatment conditions (temperature, tension and duration). The ...

Grain boundaries are natural obstacles to the motion of dislocations during plastic straining of crystalline matter. As such, they may be the cause of grain-scale heterogeneity in terms of the mismatch of the elastic-plastic strain rate, internal stress, and crystallographic reorientation rate fields.

Electron beam welding, despite a long history and widespread arc and laser technology, is still widely used in industry. The main applications for this high efficiency welding process are: automotive, electronics, electrical engineering, aerospace and mechanical engineering industry.

Dual-phase steels (DP steels) consist of ferrite and a dispersed hard martensitic second phase in the form of islands. Usually they are low-carbon low-alloy materials with 10-40 vol.% hard martensite or martensite-austenite particles embedded in a ductile ferrite matrix. As they combine high strength and good formability at low production costs they are widely used for automotive applications.

Myelopathy describes any neurologic deficit related to the spinal cord. Myelopathy is usually due to compression of the spinal cord by osteophyte or extruded disk material in the cervical spine. Osteophytic spurring and disk herniation may also produce myelopathy localized to the thoracic spine,
