An equation is analogous to a weighing scale, balance, or seesaw.. Each side of the equation corresponds to one side of the balance. Different quantities can be placed on each side: if the weights on the two sides are equal, the scale balances, and in analogy the equality that represents the balance is also balanced (if not, then the lack of balance corresponds to an inequality represented by ...

A Thermochemical Equation is a balanced stoichiometric chemical equation that includes the enthalpy change, \hat{H} . In variable form, a thermochemical equation would look like this: $A + B \hat{+} C \hat{H} = (\hat{\pm}) \#$ Where {A, B, C} are the usual agents of a chemical equation with coefficients and $\hat{\pm}$ is a positive or negative numerical value, usually with units of kJ.

Absolute pressure: pressure is measured in psi (pounds per square inch) in the imperial system and kPa (kiloPascal or bar) in the metric system. Most pressure measurements are made relative to the local atmospheric pressure. In that case we add a "g" to the pressure measurement unit such as psig or kPag.
